Vehicle Dimension and Performance Summary

Performance predictions in this report represent an estimate of vehicle performance based on standard operating conditions. Variations in customer equipment, load configuration, ambient conditions, and/or operator driving techniques can cause significant variations in vehicle performance. These values are not representative of results that may be shown in actual dynamometer tests. This report should therefore be used as a guide for comparative vehicle performance.

Prices and content availability as shown are subject to change and should be treated as estimates only. Actual base vehicle, package and option pricing may vary from this estimate because of special local pricing, availability or pricing adjustments not reflected in the dealer's computer system. Figure 1 consists of two line graphs, (a) and (b), plotting the rate of reaction against temperature. Both graphs have a y-axis labeled 'Rate of reaction' and an x-axis labeled 'Temperature'. Graph (a) shows a curve that starts at a low rate at low temperatures and rises very steeply as temperature increases, indicating a high activation energy. Graph (b) shows a curve that starts at a low rate at low temperatures and rises gradually as temperature increases, indicating a lower activation energy.

The diagrams show a right angle (90 degrees) and a straight angle (180 degrees). The right angle is formed by two perpendicular rays meeting at a vertex, with an arc indicating the angle. The straight angle is formed by two rays meeting at a vertex and extending in opposite directions, forming a straight line, with an arc indicating the angle.
