## EXECUTIVE SUMMARY

Kimley-Horn and Associates, Inc., (Kimley-Horn) was retained by Cannon Design to prepare a traffic impact study for a proposed orthopedics facility located at the western terminus of Fran Lin Parkway, approximately 260 feet west of Calumet Avenue in Munster, Indiana. The proposed development would include a medical office building totaling 29,980 square feet. The medical office building would house a Midwest Orthopaedics at Rush (MOR) outpatient facility. The subject site is currently vacant, undeveloped land. Access to the site would be provided by two access driveways on the west side of the internal roadway west of Calumet Avenue serving existing commercial and industrial developments (referred to herein as Frontage Road). The proposed development is expected to be completed in 2026.

This traffic impact study evaluates existing and future traffic conditions for area intersections following the development of the subject site. Based on a review of future traffic conditions, site-generated traffic is not expected to materially impact the study intersections along Calumet Avenue and Fran Lin Parkway. Under Build Year 2026 conditions, the study intersections and approaches are expected to operate at similar levels of service compared to existing conditions. Therefore, off-site improvements were not included in the analysis of future conditions.

A parking evaluation was also completed for the subject site and, based on data from the operator and the national Institute of Transportation Engineer's database, the proposed parking supply of 159 spaces is expected to accommodate peak parking demand. Spillover of parking to adjacent parcels or roadways is not anticipated.

At the access driveways to Frontage Road, one inbound and outbound lane should be provided. Minor-leg stop-control should be provided for outbound traffic with a stop sign and stop bar. These recommendations and study results are discussed in more detail in the *Recommendations & Conclusions* section of this report.

## 1. INTRODUCTION

Kimley-Horn and Associates, Inc., (Kimley-Horn) was retained by Cannon Design to prepare a traffic impact study for a proposed development located in the southwest quadrant of the Calumet Avenue/Fran Lin Parkway intersection in Munster, Indiana. The proposed development would include a 29,980-square foot medical office building and a parking lot with 159 total spaces. An aerial view of the study location and the surrounding roadway network is presented in **Exhibit 1**.

Access to the development would be provided via two access driveways (North Access and South Access). North Access is located at the western terminus of Fran Lin Parkway and would be the west leg of the unsignalized intersection of Fran Lin Parkway/Frontage Road. South Access is located approximately 110 feet south of North Access and is aligned between the existing driveways for the commercial developments on the east side of Frontage Road.

As a part of this study, the existing network was analyzed to determine the current operations at the study intersections. In order to assess the site's impact on the area roadway network, site-generated trips were established and added to background traffic volumes. Consistent with Indiana Department of Transportation (INDOT) requirements, future traffic conditions were evaluated for anticipated occupancy of development.

This report presents and documents the study methodology, summarizes data collection and development traffic characteristics, highlights the evaluation of traffic conditions on the study intersections and roadways, and identifies recommendations to address operational impacts and integrate the proposed development into the surrounding transportation system.

## **2. EXISTING CONDITIONS**

Kimley-Horn reviewed the subject site and surrounding area to collect relevant information pertaining to site context, surrounding land uses, the adjacent street system, current traffic volumes and operating conditions, lane configurations and traffic controls at nearby intersections, and other key transportation characteristics. This section of the report details information on existing conditions.

### **Area Land Uses & Connectivity**

Regional access near the site is provided by Interstate 94 (I-94), Illinois Route 394 (IL 394), and Indianapolis Boulevard. I-94 provides east-west access across northern Indiana with connectivity to adjacent states. A full interchange to I-94 is provided at Calumet Avenue approximately 1.9 miles north of the site. IL 394 provides north-south access west of the site and Indianapolis Boulevard provides north-south access east of the site.

The surrounding area is primarily residential development with commercial and industrial developments concentrated on the primary arterials of the surrounding roadway network. The subject property is bounded by commercial developments to the east and industrial developments to the north, south, and west. Community Hospital is located approximately 1,000 feet north of the subject site on the east side of Calumet Avenue and Rush Munster medical center is located immediately north of the subject site.

### **Existing Roadway Characteristics**

The following information was obtained about the existing roadway network based on available maps and aerial imagery.

**Calumet Avenue** is a four-lane, north-south roadway classified by INDOT as a Principal Arterial in the study area. North of Fran Lin Parkway, Calumet Avenue provides two travel lanes in each direction with dedicated left-turn lanes provided at intersections and driveways. South of Fran Lin Parkway, Calumet Avenue provides two travel lanes in each direction with a continuous two-way left-turn lane (TWLTL) in the center median. At its signalized intersections with Fisher Street and Fran Lin Parkway, Calumet Avenue provides a dedicated left-turn lane, one through lane, and a shared through/right-turn lane on both the north and south legs. Striped crosswalks and pedestrian pushbuttons are provided on both legs of Calumet Avenue at Fisher Street and Fran Lin Parkway. A 35-mile per hour (MPH) speed limit is posted within the vicinity of the project area. Calumet Avenue is under Town of Munster jurisdiction through the study area.

**Fisher Street** is a two-lane, east-west roadway classified by INDOT as a Major Collector. The typical section of the existing roadway includes one travel lane in each direction. At its signalized intersection with Calumet Avenue, Fisher Street provides a dedicated left-turn lane and one shared through/right-turn lane on the east and west legs. Striped crosswalks and pedestrian pushbuttons are provided on both legs of Fisher Street at Calumet Avenue. A 35 MPH speed limit is posted on Fisher Street. Fisher Street is under the Town of Munster jurisdiction.

**Fran Lin Parkway** is a two-lane, east-west roadway. Classified by INDOT as a Major Collector, Fran Lin Parkway provides a single travel lane in each direction. Near its intersection with Calumet Avenue, Fran Lin Parkway is a divided roadway with a landscaped center median. Dedicated bike lanes are

provided on both the north and south sides of the street east of Calumet Avenue. At its signalized intersection with Calumet Avenue, Fran Lin Parkway provides a dedicated left-turn lane and a shared through/right-turn lane on the east leg. On the west leg, Fran Lin Parkway provides a shared left/through lane and a dedicated right-turn lane. At its signalized intersection with Columbia Avenue, Fran Lin Parkway provides a dedicated left-turn lane, a dedicated through lane, and a dedicated right-turn lane on both the east and west legs. A striped crosswalk and pedestrian pushbuttons are provided on both legs of Fran Lin Parkway at both Calumet Avenue and Columbia Avenue. A 35 MPH speed limit is posted on Fran Lin Parkway in the study area. Fran Lin Parkway is under Town of Munster jurisdiction through the study area.

**Columbia Avenue** is a two-lane, north-south roadway classified by INDOT as a Minor Arterial. Columbia Avenue provides one travel lane in each direction with a continuous two-way left-turn lane (TWLTL) in the center median. At its signalized intersection with Fran Lin Parkway, Columbia Avenue provides a dedicated left-turn lane and a shared through/right-turn lane on both the north and south legs. A striped crosswalk and pedestrian pushbuttons are provided on both legs of Columbia Avenue at Fran Lin Parkway. A 35 MPH speed limit is posted on Columbia Avenue in the study area. Columbia Avenue is under Town of Munster jurisdiction through the study area.

## Traffic Count Data

Turning movement count data was collected in February 2025 at the intersections listed below.

- Calumet Avenue / Fisher Street
- Calumet Avenue / Fran Lin Parkway
- Columbia Avenue / Fran Lin Parkway

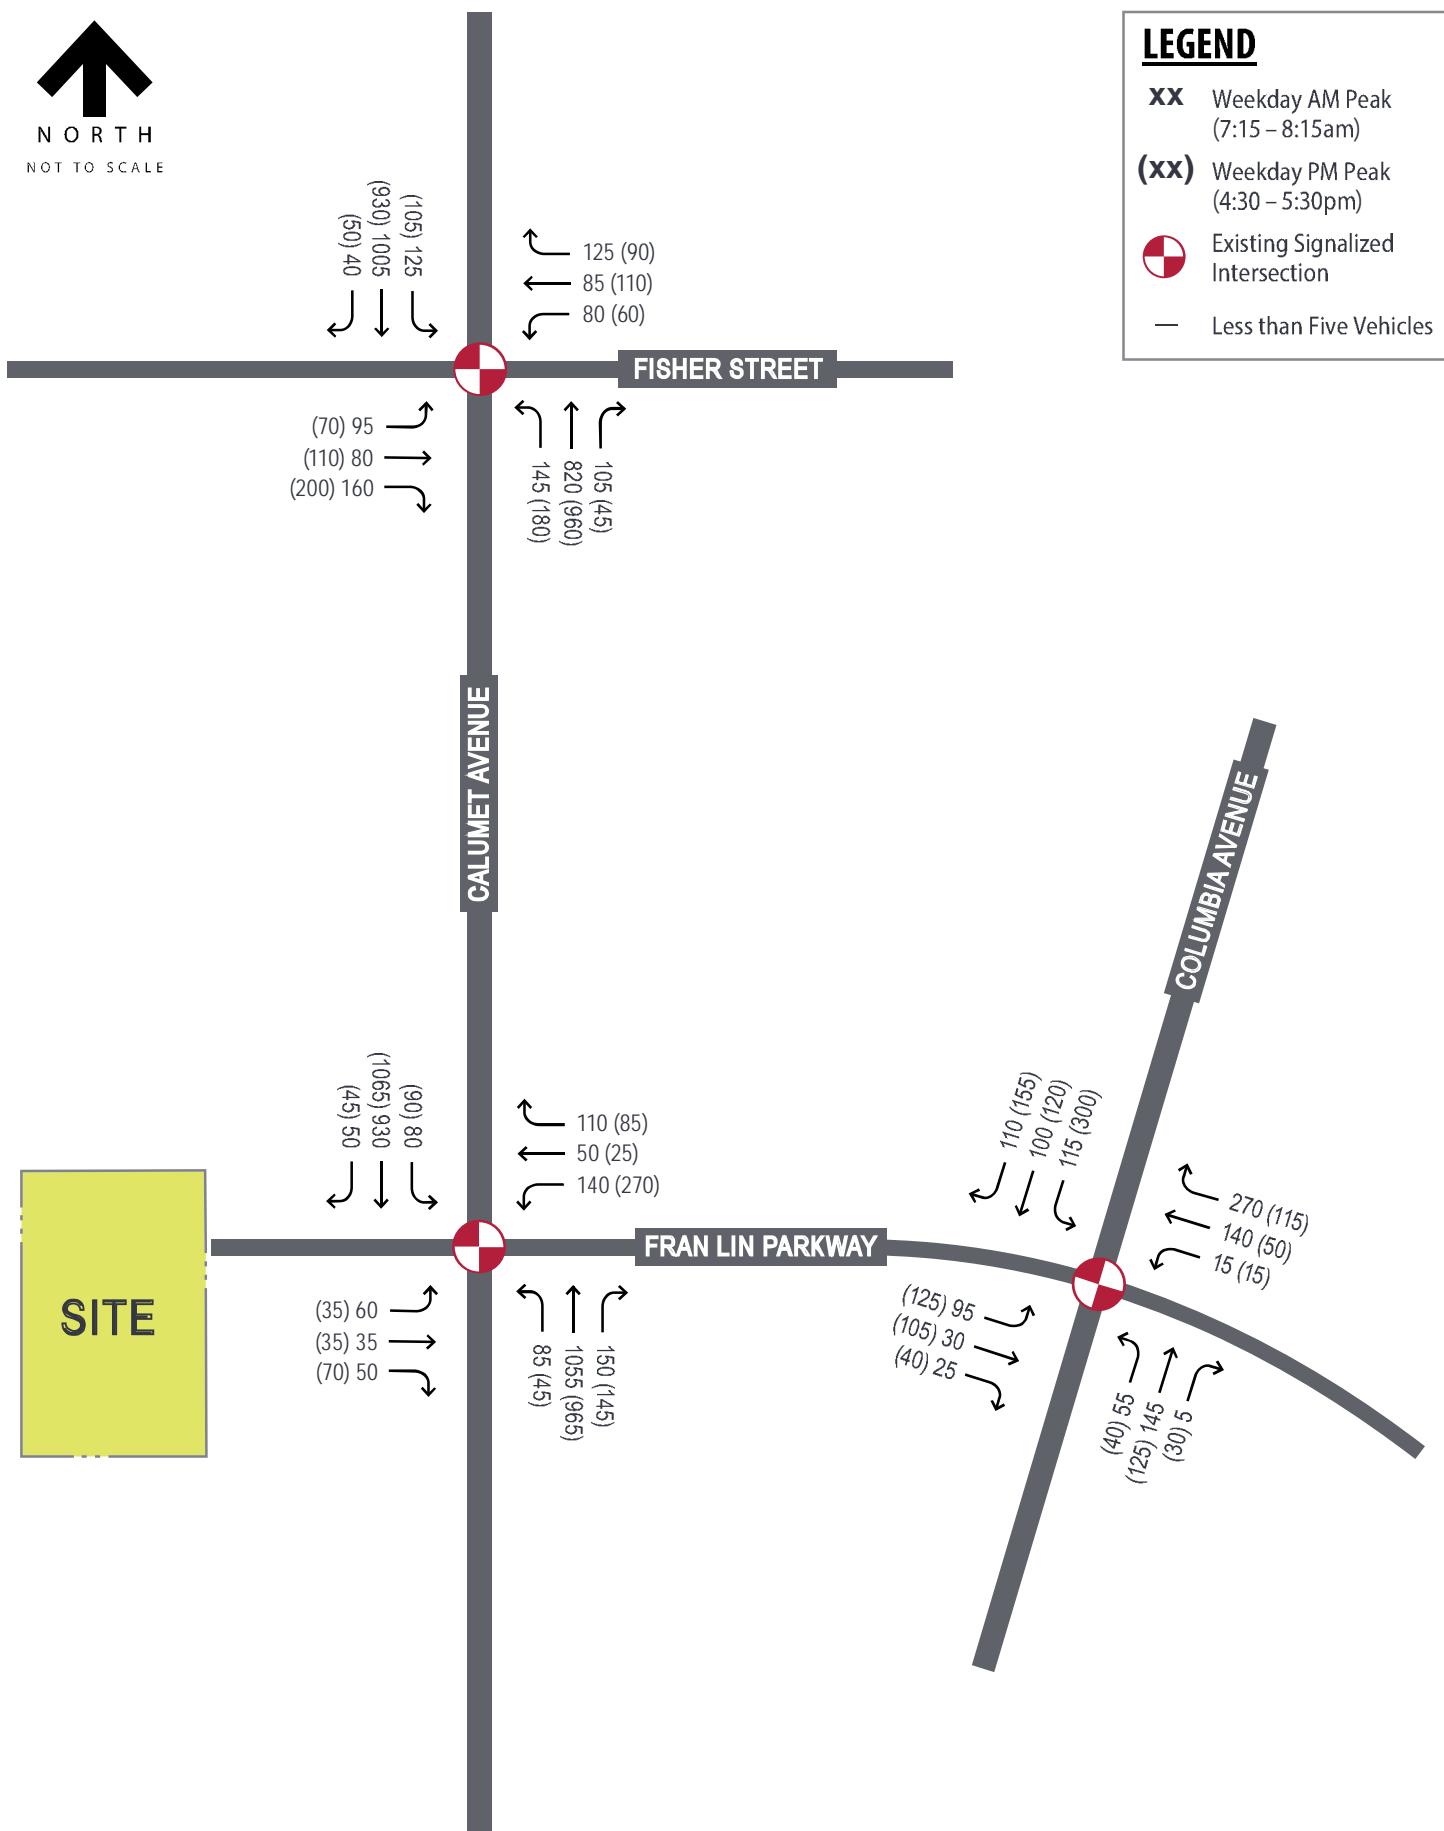

All turning movement counts were conducted on a typical weekday from 7:00-9:00AM and 4:00-6:00PM. These time periods coincide with the typical peak traffic periods of the proposed end user as well as the surrounding street system. The resulting count data reveals the peak hours of adjacent street traffic occurred from 7:15-8:15AM and 4:30-5:30PM.

The existing peak hour traffic counts, rounded to the nearest multiple of five, are presented in **Exhibit 2**. For purposes of this analysis, traffic volumes were not balanced between study intersections due to the presence of side streets and driveways along both Calumet Avenue and Fran Lin Parkway.

## LEGEND

- (xx)** Weekday PM Peak (4:30 – 5:30pm)
- Existing Signalized Intersection
- Less than Five Vehicles

## Existing Capacity Analysis

Capacity analyses were conducted to assess existing and future build operating conditions at the study intersections during the weekday peak hours. The capacity of an intersection quantifies its ability to accommodate traffic volumes and is expressed in terms of level of service (LOS), measured in average delay per vehicle. LOS grades range from A to F, with LOS A as the highest (best traffic flow and least delay), LOS E as saturated or at-capacity conditions, and LOS F as the lowest (oversaturated conditions).

The LOS grades shown below, which are provided in the Transportation Research Board's [Highway Capacity Manual](#) (HCM), quantify and categorize the driver's discomfort, frustration, fuel consumption, and travel times experienced as a result of intersection control and the resulting traffic queuing. A detailed description of each LOS rating can be found in **Table 2.1**.

Table 2.1 Level of Service Grading Descriptions<sup>1</sup>

Level of Service	Description
A	Minimal control delay; traffic operates at primarily free-flow conditions; unimpeded movement within traffic stream.
B	Minor control delay at signalized intersections; traffic operates at a fairly unimpeded level with slightly restricted movement within traffic stream.
C	Moderate control delay; movement within traffic stream more restricted than at LOS B; formation of queues contributes to lower average travel speeds.
D	Considerable control delay that may be substantially increased by small increases in flow; average travel speeds continue to decrease.
E	High control delay; average travel speed no more than 33 percent of free flow speed.
F	Extremely high control delay; extensive queuing and high volumes create exceedingly restricted traffic flow.

<sup>1</sup>Highway Capacity Manual, 7th Edition.

The range of control delay for each rating (as detailed in the HCM) is shown in **Table 2.2**. Because signalized intersections are expected to carry a larger volume of vehicles and stopping is required during red time, note that higher delays are tolerated for the corresponding LOS ratings.

Table 2.2 Level of Service Grading Criteria<sup>1</sup>

Level of Service	Average Control Delay (s/veh) at:	
	Unsignalized Intersections	Signalized Intersections
A	0 – 10	0 – 10
B	> 10 – 15	> 10 – 20
C	> 15 – 25	> 20 – 35
D	> 25 – 35	> 35 – 55
E	> 35 – 50	> 55 – 80
F <sup>2</sup>	> 50	> 80

<sup>1</sup>Highway Capacity Manual, 7th Edition

<sup>2</sup>All movements with a Volume to Capacity (v/C) ratio greater than 1 receive a rating of LOS F.

Based on the LOS standards, capacity results were identified for the study intersections under existing conditions. In order to evaluate existing traffic operations, signal timings for the study intersections were obtained from data provided by Town of Munster. It should be noted that the signalized intersections along Calumet Avenue are part of an interconnected, coordinated traffic signal system.

**Table 2.3** summarizes the capacity analysis results for existing peak hour traffic conditions. In this table, operation on each approach is quantified according to the average delay per vehicle and the corresponding level of service. Overall intersection operations are reported for all signalized intersections. The results presented in Table 2.3 are based on Synchro's HCM 7<sup>th</sup> Edition reports. Copies of the capacity analysis reports are provided in the appendix.

Table 2.3 Existing (2025) Levels of Service

Intersection	Weekday AM Peak		Weekday PM Peak	
	Delay (s/veh)	LOS	Delay (s/veh)	LOS
Calumet Avenue / Fisher Street *				
Eastbound	63	E	65	E
Westbound	58	E	44	D
Northbound	17	B	19	B
Southbound	18	B	21	C
Intersection	27	C	28	C
Calumet Avenue / Fran Lin Parkway *				
Eastbound	60	E	60	E
Westbound	48	D	41	D
Northbound	14	B	18	B
Southbound	13	B	17	B
Intersection	20-	B	23	C
Columbia Avenue / Fran Lin Parkway *				
Eastbound	14	B	18	B
Westbound	22	C	22	C
Northbound	18	B	18	B
Southbound	18	B	14	B
Intersection	19	B	17	B

\* -Signalized Intersection

As shown in Table 2.3, the study intersections currently operate at an overall LOS C or better during both peak hours. The majority of approaches operate at LOS D or better during both peak hours and the 95<sup>th</sup> percentile queues for each movement are accommodated within the existing storage. Exceptions are listed below.

At the intersection of Calumet Avenue/Fisher Street, the eastbound approach operates at LOS E during both peak hours and the westbound approach operates at LOS E during the morning peak hour. This is, in part, attributable to the signal timing priority given to north-south traffic on Calumet Avenue. The estimated 95<sup>th</sup> percentile queues for both the eastbound and westbound left-turn

movements are approximately 125 feet (5 vehicles) or less, which is accommodated within the existing storage provided.

At the intersection of Calumet Avenue/Fran Lin Parkway, the eastbound approach operates at LOS E during both peak hours. Similar to the intersection of Calumet Avenue/Fisher Street, this is attributable to the signal timing priority given to north-south traffic on Calumet Avenue as well as the eastbound left-turn movement operating with permitted-only phasing. The estimated 95<sup>th</sup> percentile queues for the eastbound approach are approximately 150 feet (6 vehicles) or less during the peak hours. This is accommodated within the existing storage as there is approximately 170 feet of storage from the intersection of Frontage Road/Fran Lin Parkway to Calumet Avenue. The westbound approach operates acceptably at LOS D during both peak hours. The estimated 95<sup>th</sup> percentile queue for the westbound left-turn movement is approximately 200 feet (8 vehicles) in the morning peak hour and 300 feet (12 vehicles) in the evening peak hour.

### 3. DEVELOPMENT CHARACTERISTICS

This section of the report outlines the proposed site plan, summarizes site-specific traffic characteristics, and develops future traffic projections for analysis.

#### Development Characteristics

The proposed development would occupy the undeveloped parcel at the western terminus of Fran-Lin Parkway on the west side of Frontage Road. The development site plan includes a 29,980 square-foot medical-office building and a parking lot with a total supply of 159 spaces. The medical-office building would provide musculoskeletal health services from diagnosis to treatment, recovery, and physical therapy. Access to the development would be provided via two access driveways on the west side of Frontage Road. A copy of the site plan is provided in the appendix.

#### Trip Generation

In order to calculate trips generated by the proposed development, data was referenced from the Institute of Transportation Engineers (ITE) *Trip Generation Manual, 11<sup>th</sup> Edition*. Trip generation rates for the ITE Land Use Code (LUC) corresponding to the proposed use are shown in **Table 3.1**. Due to the proposed development providing diagnosis and outpatient care but not prolonged in-house medical and surgical care, LUC 720 was used. Rush Munster is located immediately north of the subject site and Community Hospital is located approximately 1,000 feet north of the subject site on the east side of Calumet Avenue; therefore, the subcategory “within/near hospital campus” was selected. Copies of the ITE data are provided in the appendix.

Table 3.1 ITE Trip Generation Data

ITE Land Use	Unit	Daily	AM Peak Hour	PM Peak Hour
Medical-Dental Office Building- Within/ Near Hospital Campus (LUC 720)	Per 1,000 sq. ft.	$T = 35.59(X) - 127.95$ 50% in/50% out	$T = 2.72(X) - 1.53$ 81% in/19% out	$T = 3.05(X) - 7.38$ 25% in/75% out

X = square feet (SF) of development

The site-generated trips estimated for the peak hours were rounded to the nearest multiple of five and daily trips were rounded to the nearest multiple of ten. Projected site traffic volumes are summarized in **Table 3.2**.

Table 3.2 Site-Generated Traffic Projections

Land Use	Unit	Daily	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Medical-Dental Office Building- Within/ Near Hospital Campus (LUC 720)	29,980 sq. ft.	940	65	15	80	20	65	85

<sup>1</sup>In/Out volumes are rounded to the nearest multiple of five. For rounding purposes, total volumes are a sum of in and out.

#### Directional Distribution

The estimated distribution of site-generated traffic on the surrounding roadway network as it approaches and departs the site is a function of several variables, such as the nature of surrounding land uses, prevailing traffic volumes/patterns, and the ease with which motorists can travel various

sections of the area roadway network. The anticipated directional distribution of site-generated trips is presented in **Table 3.3**.

**Table 3.3 Estimated Trip Distribution**

Traveling to/from	Site-Generated Trips
North via Calumet Avenue	50%
South via Calumet Avenue	35%
North via Columbia Avenue	10%
East via Fran Lin Parkway	5%
Total	100%

The site traffic assignment, representing traffic volumes associated with the proposed development at the study intersections, is a function of the estimated trip generation (Table 3.2) and the directional distribution (Table 3.3). The site trip assignment for the proposed development is presented in **Exhibit 3**.

### LEGEND

- (xx)** Weekday PM Peak (4:30 – 5:30pm)
- Existing Signalized Intersection
- Less than Five Vehicles

## **4. FUTURE CONDITIONS**

This section of the report outlines the proposed site plan, summarizes site-specific traffic characteristics, and develops future traffic projections for analysis.

### **Future Background Traffic Projections**

Background traffic projections were estimated using the INDOT [Traffic Count Map \(TCMap\)](#). Based on the available historical Annual Average Daily Traffic (AADT) data, an average annual growth rate of 1.2 percent per year was applied to existing traffic volumes (Exhibit 2) for a 1-year period to estimate Year 2026 background traffic volumes. Background traffic projections for Year 2026 are presented in **Exhibit 4**.

### **Future Build Traffic Projections**

To develop future build traffic projections, site-generated traffic (Exhibit 3) was added to background traffic projections (Exhibit 4). Future (2026) Build traffic projections are illustrated in **Exhibit 5**.

### **Future Geometry**

A southbound right-turn lane was evaluated at Calumet Avenue/Fran Lin Parkway using guidelines in the *INDOT Design Manual* (IDM). The study intersection is signalized; therefore, IDM guidance for right-turn lanes at signalized intersections was referenced. A right-turn lane at a signalized intersection is warranted where capacity analysis determines the turn lane is needed to meet level-of-service criteria. As shown in the analysis of future build conditions, the southbound approach is expected to operate at LOS B and LOS C during the morning and evening peak hours, respectively. Based on these levels of delay, a southbound right-turn lane was not included in the analysis of future conditions.

## Future Build Capacity Analysis

Capacity results were identified for the study intersections under Future (2026) Build conditions (Exhibit 5). The results of the capacity analysis are summarized in **Table 4.1**. Consistent with the analysis of existing conditions, the results are based on Synchro's HCM 7<sup>th</sup> Edition reports. Copies of these reports are included in the appendix.

Table 4.1 Future (2026) Build Levels of Service

Intersection	Weekday AM Peak		Weekday PM Peak	
	Delay (s/veh)	LOS	Delay (s/veh)	LOS
Calumet Avenue / Fisher Street *				
Eastbound	63	E	65	E
Westbound	58	E	44	D
Northbound	17	B	20-	B
Southbound	19	B	21	C
Intersection	27	C	28	C
Calumet Avenue / Fran Lin Parkway *				
Eastbound	59	E	55+	E

Southbound	14	B	20+	C
Intersection	21	C	26	C
Columbia Avenue / Fran Lin Parkway *				
Eastbound	14	B	18	B
Westbound	22	C	22	C
Northbound	18	B	19	B
Southbound	18	B	14	B
Intersection	19	B	17	B

\* - Signalized Intersection

With the addition of background traffic and site-generated trips, all study intersections are expected to operate at the same level of service as existing conditions, with the exception of the Calumet Avenue/Fran Lin Parkway intersection during the morning peak hour. Under existing conditions, this intersection operates at LOS B, nearing the threshold to LOS C. Under build conditions, delay per vehicle at this intersection is expected to increase by approximately one second, resulting in this intersection projected to operate at LOS C in the future.

Additionally, the majority of approaches are expected to operate at similar levels of service under build conditions as existing conditions. The eastbound approach of Calumet Avenue/Fran Lin Parkway is expected to continue to operate at LOS E during both peak hours, consistent with existing conditions. The 95<sup>th</sup> percentile queue for the eastbound left-turn movement is projected to increase by one vehicle (25 feet) under build conditions during both peak hours, indicating minimal impacts to existing traffic operations at this intersection.

All other 95<sup>th</sup> percentile queues at the study intersections are projected to be accommodated by the existing storage lengths, consistent with existing conditions.

## Parking Evaluation

A total of 159 parking spaces, including 16 Americans with Disabilities Act (ADA) spaces, would be provided at the subject site, as shown on the site plan. Per the Town of Munster Zoning Ordinance, Medical Office Buildings are required to provide 5.7 spaces per 1,000 square feet of floor area. Therefore, a total of 171 spaces would be required for the proposed development per code. A total of 159 spaces would be provided, which does not satisfy local requirements.

### ITE Parking Generation

Kimley-Horn reviewed parking demand data provided in the Institute of Transportation Engineers (ITE) Parking Generation Manual, 6<sup>th</sup> Edition to estimate the required parking supply per industry resources. Consistent with trip generation, LUC 720, Medical-Dental Office Building, near a hospital campus, was assumed for the proposed use. The average and 85<sup>th</sup> percentile parking generation rates are provided in **Table 4.2** and the data is provided in the Appendix.

Table 4.2 ITE Parking Generation Rates

ITE Land Use	Unit (X)	Monday – Friday	
		Average	85 <sup>th</sup> Percentile
Medical-Dental Office Building- Within/ Near Hospital Campus (LUC 720)	1,000 sq. ft.	S = 3.58X	S = 4.75X

As shown in **Table 4.3**, based on ITE parking demand data, the proposed parking supply of 159 spaces would accommodate the average and 85<sup>th</sup> percentile project parking demand on a typical weekday.

Table 4.3 Peaking Generation Estimates

Land Use Code	Size	Monday – Friday	
		Average	85 <sup>th</sup> Percentile
Medical-Dental Office Building- Within/ Near Hospital Campus (LUC 720)	29,980 sq. ft.	107	142

### Operational Parking Demand

Based on coordination with MOR, the following on-site staff, patients, and family members are expected during a typical weekday:

- Clinic staff: 30 employees daily
- Clinic patients: 48 per hour
- Physical therapy patient: 40 per hour
- Family members: 30 per hour

Peak operational parking demand was developed using the above assumptions. The number of required parking spaces per each group is provided in **Table 4.4**. It was assumed that all staff will drive to the site individually (one employee = one vehicle). It is expected that some carpooling will

occur with patients and family members. Therefore, it was assumed that approximately half of the family members would travel in the same vehicle as the clinic and/or physical therapy patients.

**Table 4.4 Operational Parking Demand**

Category	Hourly Parking Demand
Clinic Staff	30 spaces
Clinic Patients	48 spaces
Physical Therapy Patients	40 spaces
Family Members	15 spaces
<b>Total</b>	<b>133 spaces</b>

<sup>1</sup>It was assumed that 50% of the hourly family members expected on site would travel to the site in the same vehicle as the clinic/physical therapy patient.

Based on a review of ITE parking demand data and operational parking demand data, the parking supply of 159 spaces will accommodate anticipated parking demand. The operational data is specific to the proposed use and is expected to most accurately reflect anticipated parking demand. Although the proposed parking supply is less than the local requirements, based on data from the operator and the national ITE database, spillover of parking to adjacent parcels or roadways is not anticipated.

## **5. RECOMMENDATIONS & CONCLUSIONS**

Based on Kimley-Horn's review of the proposed site plan and evaluation of existing and future traffic conditions, the consistency between existing and build conditions results indicate traffic generated by the proposed medical-office building is not expected to materially impact operations at any of the study intersections. The study intersections are projected to adequately accommodate the proposed development with the following recommendations:

- Provide a single inbound and outbound lane at North Access and South Access.
- Install minor-leg stop control for outbound traffic at the access driveways.

A parking evaluation was also completed for the subject site and, based on data from the operator and the national database, the proposed parking supply of 159 spaces is expected to accommodate peak parking demand. Spillover to adjacent parcels or roadways is not anticipated.

Regardless of the final configuration of the intersection geometrics, several additional items should be taken into consideration when preparing site and roadway improvement plans for the subject development. As the site design progresses, care should be taken with landscaping, signage, and monumentation at the site access locations to ensure that adequate horizontal sight distance is maintained. If alterations to the site plan or land use should occur, changes to the analysis provided within this traffic impact study may be needed.

---

### Description

A medical-dental office building is a facility that provides diagnoses and outpatient care on a routine basis but is unable to provide prolonged in-house medical and surgical care. One or more private physicians or dentists generally operate this type of facility. General office building (Land Use 710) and clinic (Land Use 630) are related uses.

### Land Use Subcategory

Analysis of medical-dental office building data found that trip generation rates are measurably different for sites located within or adjacent to a hospital campus and sites that are stand-alone. Data plots are presented for these two land use subcategories.

### Additional Data

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in Alberta (CAN), California, Connecticut, Kentucky, Maryland, Minnesota, New Jersey, New York, Ohio, Oregon, Pennsylvania, South Dakota, Texas, Virginia, Washington, and Wisconsin.

### Source Numbers

104, 109, 120, 157, 184, 209, 211, 253, 287, 294, 295, 304, 357, 384, 404, 407, 423, 444, 509, 601, 715, 867, 879, 901, 902, 908, 959, 972

# Medical-Dental Office Building Within/Near Hospital Campus (720)

Vehicle Trip Ends vs: 1000 Sq. Ft. GFA

On a: Weekday

**Setting/Location: General Urban/Suburban**

Number of Studies: 6

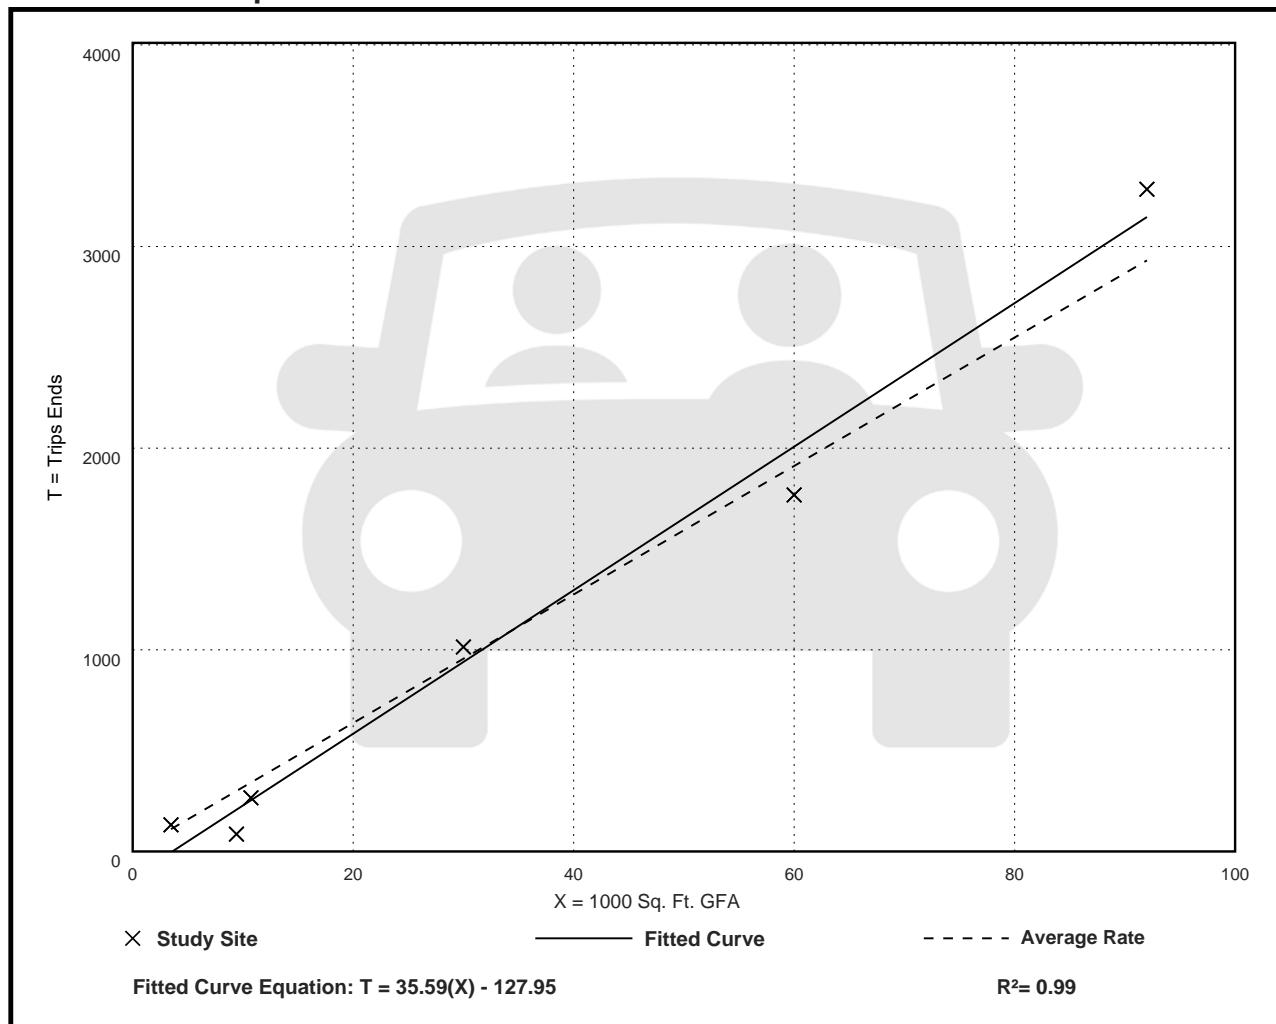

Avg. 1000 Sq. Ft. GFA: 34

Directional Distribution: 50% entering, 50% exiting

## Vehicle Trip Generation per 1000 Sq. Ft. GFA

Average Rate	Range of Rates	Standard Deviation
31.86	9.14 - 37.99	6.54

## Data Plot and Equation

# Medical-Dental Office Building Within/Near Hospital Campus (720)

Vehicle Trip Ends vs: 1000 Sq. Ft. GFA

On a: Weekday,

Peak Hour of Adjacent Street Traffic,

One Hour Between 7 and 9 a.m.

Setting/Location: General Urban/Suburban

Number of Studies: 8

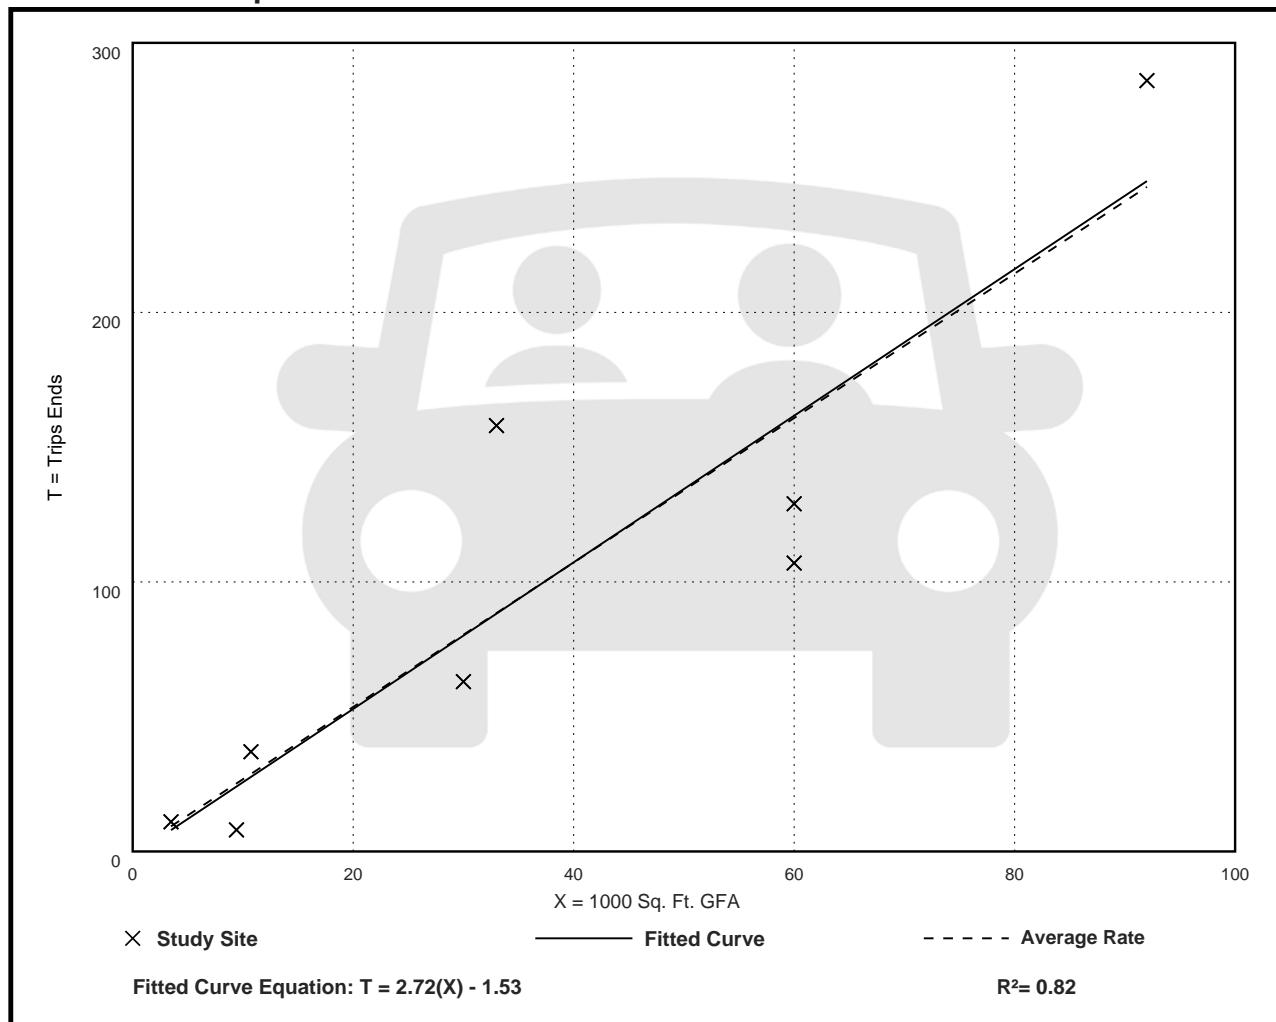

Avg. 1000 Sq. Ft. GFA: 37

Directional Distribution: 81% entering, 19% exiting

## Vehicle Trip Generation per 1000 Sq. Ft. GFA

Average Rate	Range of Rates	Standard Deviation
2.68	0.85 - 4.79	1.03

## Data Plot and Equation

# Medical-Dental Office Building Within/Near Hospital Campus (720)

Vehicle Trip Ends vs: 1000 Sq. Ft. GFA

On a: Weekday,

Peak Hour of Adjacent Street Traffic,

One Hour Between 4 and 6 p.m.

Setting/Location: General Urban/Suburban

Number of Studies: 10

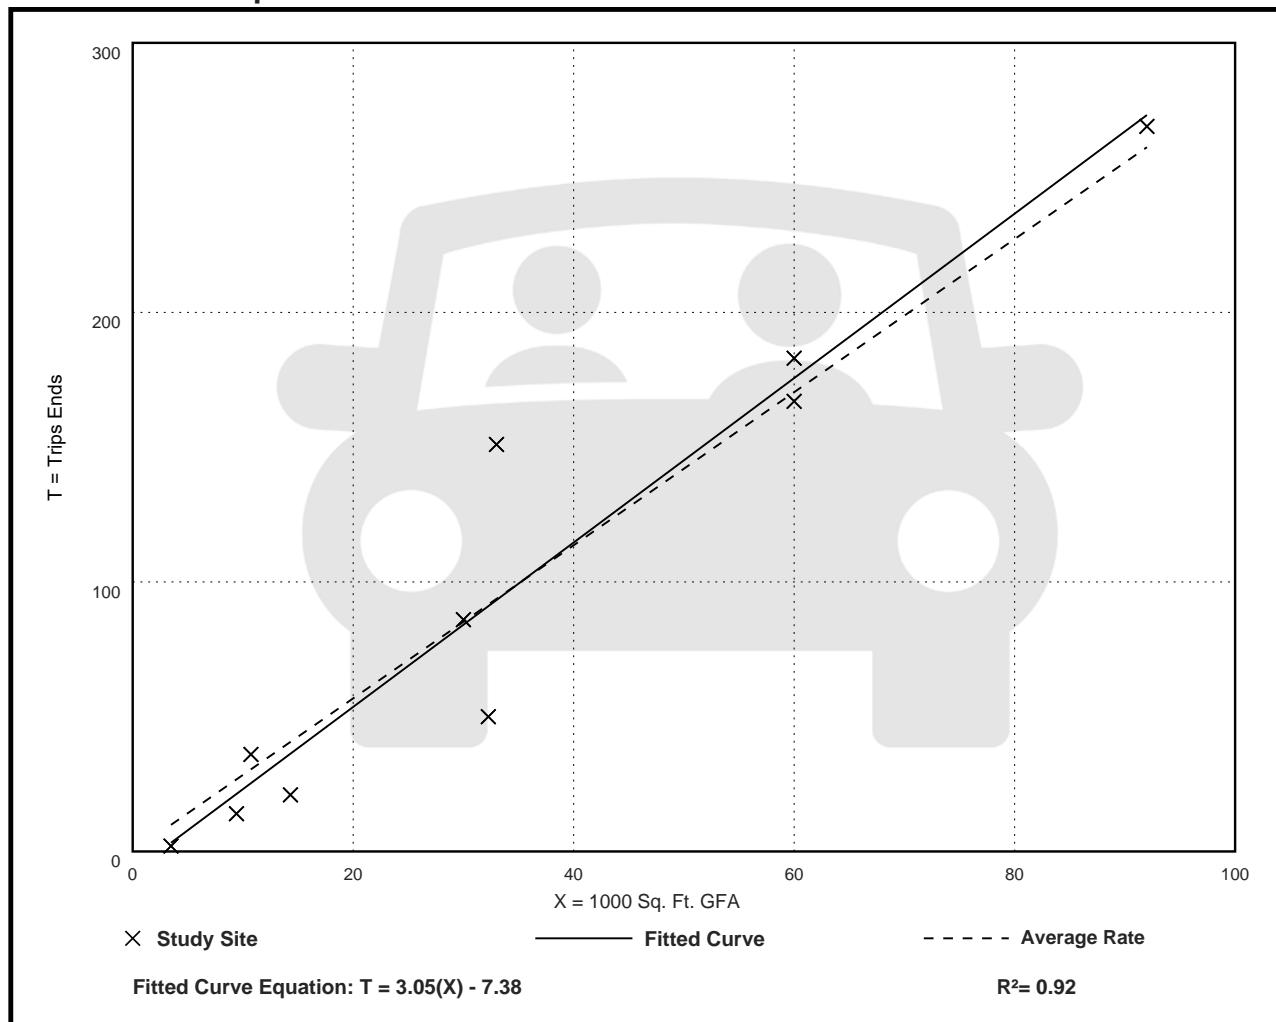

Avg. 1000 Sq. Ft. GFA: 35

Directional Distribution: 25% entering, 75% exiting

## Vehicle Trip Generation per 1000 Sq. Ft. GFA

Average Rate	Range of Rates	Standard Deviation
2.84	0.58 - 4.58	0.84

## Data Plot and Equation

**DATA FROM ITE PARKING GENERATION MANUAL, 6<sup>TH</sup> EDITION**

# Land Use: 720 Medical-Dental Office Building

## Description

A medical-dental office building is a facility or clinic with one or more tenants that provide diagnoses and outpatient care on a routine basis. Tenants range from individual private physicians and dentists to large medical practices. Patient visits are by appointment only. Walk-in clinic (Land Use 630) and urgent care center (Land Use 660) are related uses.

## Land Use Subcategory

Data are separated into two subcategories for this land use:

- Located within or adjacent to a hospital campus
- Located in a standalone setting

## Time-of-Day Distribution for Parking Demand

The following table presents a time-of-day distribution of parking demand on a weekday at 14 standalone study sites and five study sites located within or adjacent to a hospital campus.

Hour Beginning	Percent of Weekday Peak Parking Demand	
	Standalone	Hospital Campus
12:00–4:00 a.m.	—	—
5:00 a.m.	—	—
6:00 a.m.	—	—
7:00 a.m.	17	—
8:00 a.m.	47	65
9:00 a.m.	82	79
10:00 a.m.	96	100
11:00 a.m.	100	73
12:00 p.m.	88	48
1:00 p.m.	87	71
2:00 p.m.	92	98
3:00 p.m.	90	90
4:00 p.m.	86	81
5:00 p.m.	55	65
6:00 p.m.	—	—
7:00 p.m.	—	—
8:00 p.m.	—	—
9:00 p.m.	—	—
10:00 p.m.	—	—
11:00 p.m.	—	—

## **Additional Data**

The average parking supply ratio for the 15 study sites with parking supply information and located within a hospital campus is 4.7 spaces per 1,000 square feet GFA. The average peak parking occupancy at these 15 sites is 76 percent.

The average parking supply ratio for the 33 study sites with parking supply information and located as a standalone building is 4.6 spaces per 1,000 square feet GFA. The average peak parking occupancy at these 33 sites is 49 percent.

For four study sites, parking demand data were collected on a Saturday as well as a weekday. For those sites, peak Saturday parking demand averages 22 percent of the peak weekday parking demand.

The sites were surveyed in the 1990s, the 2000s, the 2010s, and the 2020s in California, Georgia, Hawaii, Maine, Maryland, Minnesota, New Jersey, New York, North Carolina, Oregon, Tennessee, Texas, Virginia, and Washington.
