Date: September 15, 2025
Subject: leachate pumping system at the landfill

The proposal from HD Mechanical is before you tonight as part of the ongoing improvements to the Centennial Park landfill leachate cell riser pump system. Previous improvements were to replace the cell riser panels and transducers and to add flow meters to the main lines. This proposal is to replace all of the cell riser pumps so the full system. This will allow the leachate to be pumped from the system as originally designed out of all of the collection cells into the storage tanks.

This proposal also replaces the covers on the two storage tanks which are brittle and pose a danger to anyone who would come into contact with them.

Additionally, there is a memo from Derek Mauntel, Andrews Engineering in regards to this subject which is further detailed and how it's important these improvements are made to satisfy IDEM requirements for the landfill which he reports on for the Town.

Recommendation:

Staff recommends approving proposal #25-1163 Rev 1 from HD Mechanical, dated 8/6/25 as part of this agenda item.
